**RE: SUN8 PDC LLC 2150 Dryden Road Projects Ecological Assessment Addendum**

Mr. Feldmann:

### **Introduction and Background**

SUN8 PDC LLC (SUN8) plans to develop a solar array system (Projects) at two different locations within the Town of Dryden, Tompkins County, New York and retained the services of Tetra Tech, Inc. (Tetra Tech) to complete a wetland delineation and habitat assessment for the proposed Projects. The 2150 Dryden Project (2150 Dryden) is an approximately 250-acre portion of the parcel located at 2150 Dryden Road (coordinates: 42.494, -76.338). Tetra Tech completed an Ecological Assessment Report, Aquatic Resources Report, and a Habitat Assessment Report and Preliminary Impact Determination (reports) for the Project site in April 2017, and a revision to the Ecological Assessment Report, submitted June 1<sup>st</sup>, 2017. This brief site visit letter report serves as an addendum to Ecological Assessment Report completed in April 2017, the revised submission in June 2017, and Letter of Clarification of updates to the Ecological Assessment Reports dated June 7<sup>th</sup>, 2017.

### **Survey Purpose**

At SUN8's request, Tetra Tech completed an additional field survey to supplement the Ecological Assessment Report on June 13, 2017. The intent was to ensure the site was evaluated in the heart of the growing season, and identify any significant changes or additional analysis required due to the change of seasons. Tetra Tech also noted general dominant flora species and fauna observed during the survey at 2150 Dryden. Similar to the field surveys completed in late March and early April 2017, a qualified biologist walked the perimeter of the property while observing the remaining interior portions by using meandering transects, and documented any additions to vegetative communities, and/or fauna that may not have been observed during earlier efforts.

### **Results**

Minor changes in fauna largely consisted of the presence of common migratory song birds that were not observed during previous survey efforts due to seasonal migration patterns. Song birds that were either directly observed or identified by call included the common yellowthroat (*Geothlypis trichas*), blue-winged warbler (*Vermivora cyanoptera*), American redstart (*Setophaga ruticilla*), black-throated green warbler (*Setophaga virens*), ovenbird (*Seiurus aurocapilla*), yellow warbler (*Setophaga petechial*), alder flycatcher (*Empidonax alnorum*), red-tailed hawk (*Buteo jamaicensis*) and wild turkey (*Meleagris gallopavo*).

Additional species of vegetation that were previously unidentifiable due to seasonality were also noted during the site visit. Generally, herbaceous species including perennials, annuals, grasses, and sedges were abundant and more easily identifiable now that it is well into the growing season. Some species of these herbaceous plants include: true forget-me-not (*Myosotis scorpioides*), spotted jewelweed (*Impatiens capensis*), swamp buttercup (*Ranunculus caricetorium*), great bladder sedge (*Carex intumescens*), fringed sedge (*Carex crinita*) and hop sedge (*Carex lupulina*).

Tetra Tech did not identify any additional habitats.

### **Conclusion**

Tetra Tech has determined that although there are additional species of dominant flora and fauna identified at 2150 Dryden during the supplemental survey, none of the species identified were rare, endangered or threatened and so would not warrant further permitting or coordination with regulatory agencies.

Tetra Tech appreciates the opportunity to work with SUN8 on these environmentally friendly energy development Projects. If you have further questions, please contact Pat Green at 716-541-9217 or via [pat.green@tetrattech.com](mailto:pat.green@tetrattech.com) with any questions.

Sincerely,  
Tetra Tech, Inc.
